99-11-26 Planet formation

- 1) Gas cloud defaults to spinning disc through random perturbation
- 2) Double star with rapidly self-orbiting components forms
- 3) Maybe one star-parasites other, any way components become unaver
- 4) Separation increases or normal or momentum loss occurs (gravitation of the universe)
- 5) Eventually smaller component breaks up and forms planets or separation increases - check non-sun focus of planetary orbits

Note: check non-sun focus of planetary orbits
