

It may be possible to 'train' super sportsman with the aid of computer programs which force physical responses to simulated situations, similar to the procedures for training brain-damaged individuals, but much extended so that the simulators were much more complex and the training done with whole- or part-body woggles. For example, a tennis player might be trained in front of a video screen which showed a ball coming towards them hit by an opponent (either a filmed real opponent or an animation but very lifelike simulation), with the woggle suit forcing the appropriate response. In that way responses to a range of physical situations could be 'burned in' to the receiver response mechanisms, available then for use without the woggles.

It should be possible to grow rows of trees, thin root, produced either from a 'whip' or from a root. Scions could be either grafted directly on the 'rhizome' or barked and notched shoots, e.g.:

(B) Whip placed almost horizontally in trench, root buried down & covered.

(C) Scions side grafted on root tube or grafted by notches into hole or tunnel through rhizome.
