

Induced infertility is the key to successful pest control.

ELECTROSETTING GLUES

1986 March 13

It should be possible to make glues and adhesives which cure or set on passing an electric current through them. This could be an electricity-cured cure directly, or more likely an effect caused by local resistance heating. A method of achieving this would be to mix carbon or metal fibres in the adhesive to provide a conduction route. The glue would be particularly good for binding boards etc
