INTERNAL BUDDING

170

Last Aug 12

In some part of the tree surface, 'sap' is moving up, and in others down. Essential in 'budding' to feed the newly inserted bud. Would it be possible, or advantageous, to insert the bud under the outer layer without breaking it (eg by cutting a slot right through tree) and pushing in a similar bud slot?

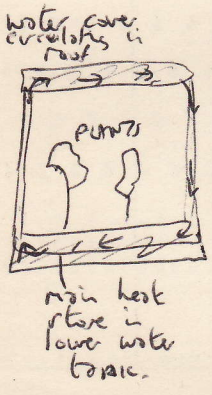
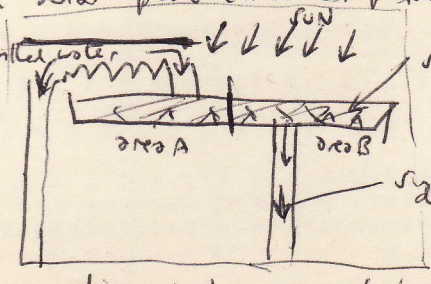
MAKING HOT WATER SINK

1985 Aug 8.

Hot water rises above cold because it is less dense. In some applications, eg the water-circulating greenhouse, it would be useful to have the hot water sink, to avoid pumping.

This may be possible using, eg, salt solutions (is this the principle behind solar power-collection ponds?).





Concept: Evaporating water from a salt solution makes it more concentrated and hence denser. It will then sink in a medium of lower concentration at the same, or possibly a lower, temperature

Distillation/concentration areas (A, B etc) can alter automatically as sun moves in orientation
