

use the bud or graftwood here. Maximum encouragement to grow; feeder leaves not look.

1980-1-30. Conservation of greenhouse water/leak

TIDAL POWER - BUOYANCY MASS

1980-2-6

Concept: instead of using tidal water flow to generate power, use the inflow water to lift a large mass with a near specific gravity ~~just~~ below that of water. When the tide falls, the water can be allowed to flow out. The mass can be slowly released to provide power. Many masses can be raised, and lowered at any time, to meet power needs.
